ABSTRACT

The OD request automation is an application for assisting a class incharge in managing OD list of students of their class. The system would provide basic set of feature to request OD for a student, decline/approve OD request of a student for a class incharge, counselor and Head of department and view list of student who got OD on particular day.

OD request automation is a typical management information system (MIS), its development include the establishment and maintenance of back-end database and front-end application development aspects. For the former require the establishment of data consistency and integrity of the strong data security and good libraries. As for the latter requires the application full functional, easy to use and so on.

1. INTRODUCTION

1.1 INTRODUCTION

The OD (On-Duty) Request Automation project is designed to streamline the process of submitting, approving, and tracking OD requests within an educational institution. The system caters to four types of users: Students, Class Incharge, Counselors, and Head of Department (HOD). Using a combination of Python with Tkinter for the graphical user interface and PostgreSQL for the database management, this project aims to enhance efficiency, reduce paperwork, and ensure transparency in the OD request process.

1.2 OBJECTIVES

- Automate the OD request submission and approval process.
- Ensure transparency and traceability of requests and their statuses.
- Minimize manual intervention and paperwork.
- Provide a clear and user-friendly interface for all users.
- Enable Class Incharge to view students on OD on a particular day.

1.3 MODULES

- **Student Module:** Allows students to submit OD requests and view their status.
- **Class Incharge Module:** Enables class incharges to approve or decline OD requests and view students on OD.
- **Counselor Module:** Facilitates counselors to approve or decline OD requests forwarded by class incharges.
- **Head of Department Module:** Allows HOD to approve or decline OD requests forwarded by counselors.

2. SURVEY OF TECHNOLOGIES

2.1 SOFTWARE DESCRIPTION

- **Python:** A versatile programming language used for backend logic and handling the Tkinter GUI.
- **Tkinter:** A standard GUI library for Python, used to create the graphical user interface.
- **PostgreSQL:** A powerful, open-source relational database system used to manage and store application data.

2.2 LANGUAGES

2.2.1 SQL

- **SQL (Structured Query Language)** is used to interact with the PostgreSQL database. It allows for querying, updating, and managing the data within the database.

2.2.2 PYTHON

- **Python** is the main programming language used in this project. It provides the backend logic, database interactions, and the GUI through Tkinter.

3. REQUIREMENTS AND ANALYSIS

3.1 REQUIREMENT SPECIFICATION

- **Functional Requirements:**

- User authentication and role-based access.
- OD request submission by students.
- Approval/Decline functionality for Class Incharge, Counselor, and HOD.
- Notification system for request status changes.
- Viewing OD status and history.

- **Non-Functional Requirements:**

- System should be reliable and secure.
- The interface should be user-friendly.
- The application should be scalable and maintainable.

3.2 HARDWARE AND SOFTWARE REQUIREMENTS

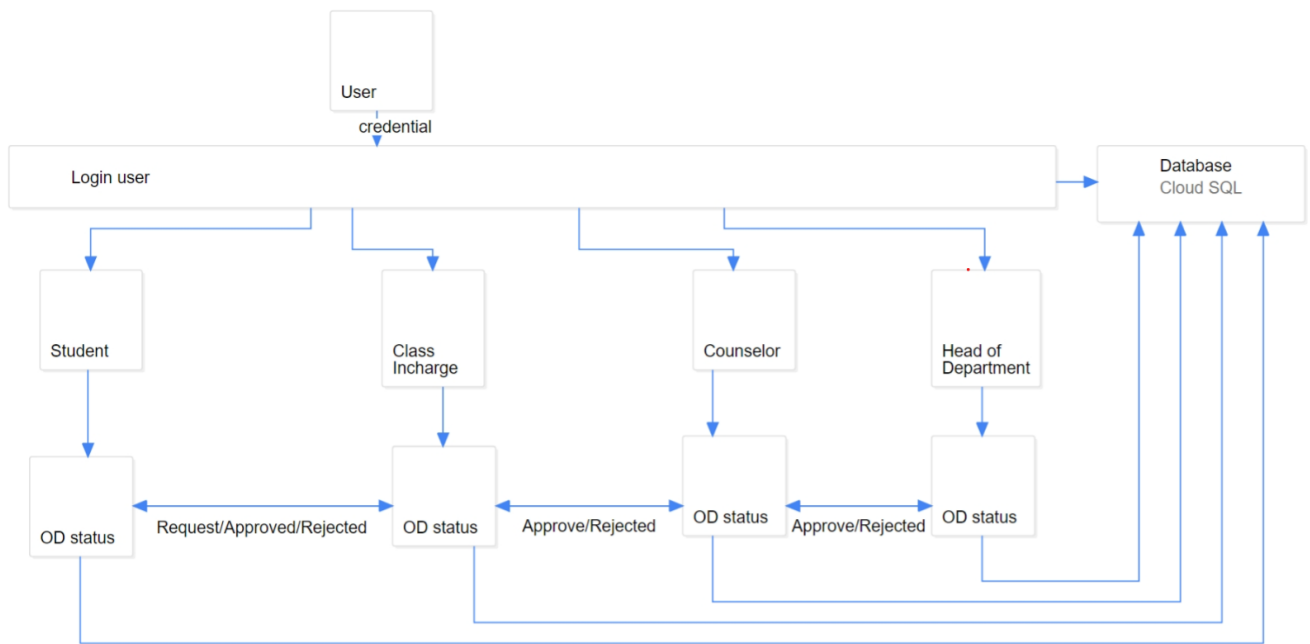

- **Hardware Requirements:**

- A computer with a modern processor (Intel i5 or equivalent).
- Minimum 4GB RAM.
- Minimum 500GB HDD/SSD.

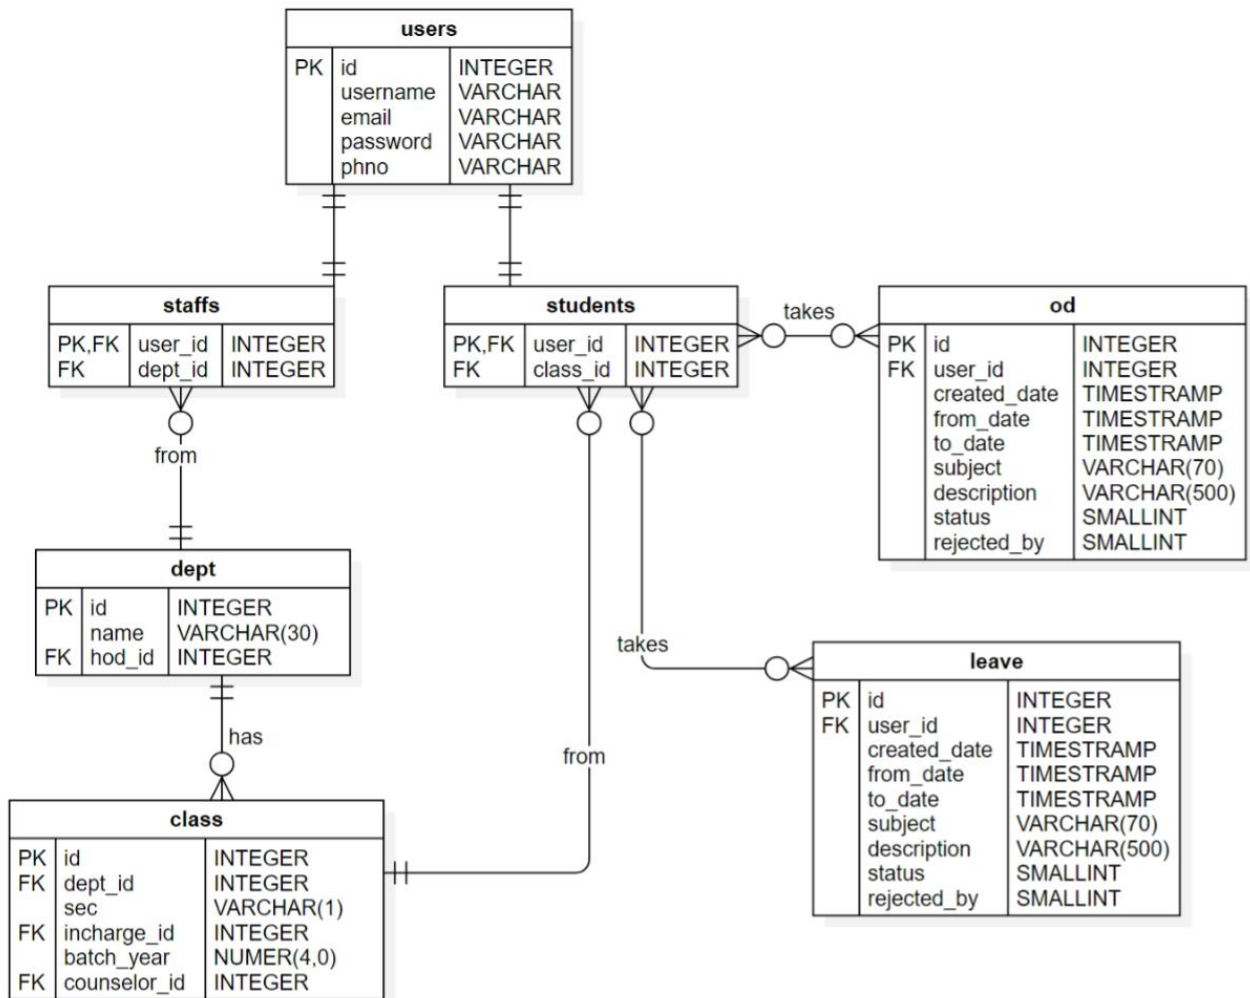

- **Software Requirements:**

- Python 3.x
- Tkinter library
- PostgreSQL
- psycopg2 (PostgreSQL adapter for Python)

The OD Request Automation system successfully automates the request and tracking of OD requests to Class Incharge, Counsellor and Head of department. The system improves efficiency by reducing manual paperwork and streamlines communication between students and faculty. Each user role has been carefully integrated to ensure that the process flows smoothly from request submission to final approval or rejection. The system's GUI, built with Tkinter, provides an intuitive interface, making it easy for users to navigate and perform necessary actions.

6. CONCLUSION

The OD Request Automation project achieves its objective of streamlining the OD request process within an educational institution. By utilizing Python for the backend and Tkinter for the GUI, along with PostgreSQL for robust data management.
